

Security Services

CyberThreats_

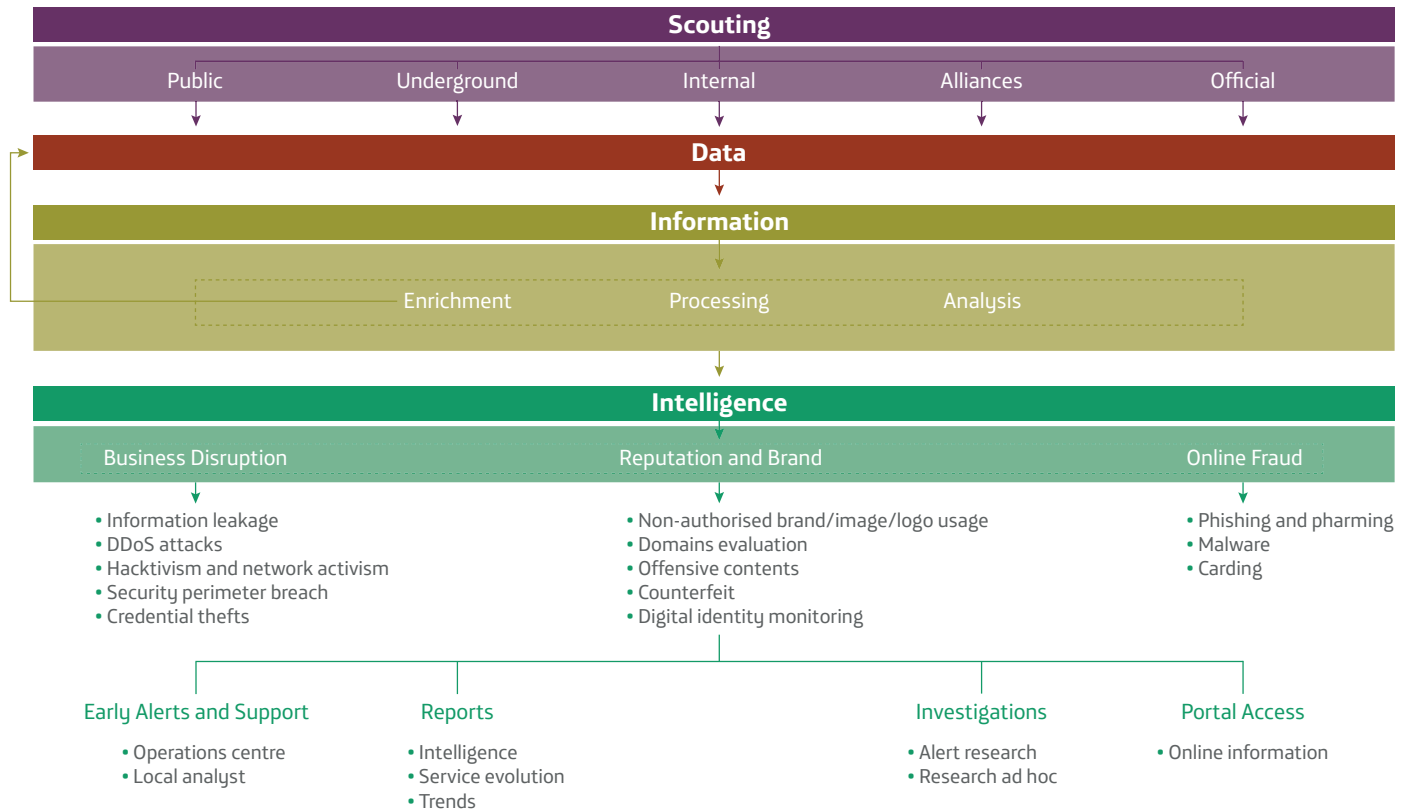

Today's world is more interconnected than ever before. Businesses collect, process and store large volumes of confidential information and transmit that data across external networks. Furthermore, an organisation's brand, reputation and assets are exposed to modern digital vulnerabilities which cannot be protected using traditional security approaches. The Internet represents a shared resource that puts organisations at risk from theft, fraud and abuse, which are controlled far beyond the corporate perimeter and can have costly implications if not detected quickly.

Cybercrime is expanding and strengthening all the time. Consisting of a consultancy service supported by operational intelligence, our **CyberThreats Service** is designed to strengthen both your own organisation and your end customers' businesses so they are ready to face and overcome the digital world's major security challenges.

Benefits:

- **Global visibility** of digital threats.
- **Accessible and real-time information** enables threats to be detected and their impact minimised.
- **Provides protection** for both an organisation's information and its reputation.
- **Minimises the vulnerability** of ICT systems.
- **High specialisation and extensive coverage** available through our experienced Global CyberSOC and local analysts.
- **Works proactively and reactively** allowing you to anticipate cyber-attacks and respond to existing ones.
- **Non-intrusive** service working 100% over open sources.
- **Fully customisable** modular service tailored to your specific industry.
- **Intelligence layer** on top of traditional services adds value to the information collected.
- **Supports decision making** by enabling effective identification, prioritisation and strategic planning.
- **Ad-hoc reports** available in addition to standard scheduled reports.

CyberThreats is a real-time consultancy and surveillance service that provides actionable, industry-specific information to support your decisions regarding the digital threats that affect your business.

Service applications

There are two options available:

- **ISPs and operators:** protection for your own organisation.
- **Reselling (B2B2C):** Sales channel to sell to your customers.

Our service, designed by a telco for telcos, can be resold to your customers directly, enabling you to provide a comprehensive solution in response to the growing importance of cyber security.

Service features

The service allows enterprises to be proactive against digital threats and adapt their security strategy accordingly thanks to:

- Data collection from open sources
- Intelligence applied to the data

Service catalogue

Each module is composed of several sub-modules that can be configured and contracted according to your needs.

Business Disruption: Identification of all activities that may affect the normal operations of your business activity.

Reputation and Brand: Monitoring of all activities that may affect your reputation or undermine the company's brand image.

Online Fraud: studying all activities that can result in fraudulent actions against your interests.

Service Operation Centre (CyberSOC)

The CyberSOC provides experienced **Local analysts**, who add local and socio-political intelligence to the existing environment, and **Operative analysts** who deliver technical intelligence.

Reports and client portal

A web-based reporting tool offering multiple customisation options, with periodic reports and ad-hoc reports available, as well as threat alarms.
